* NOTE: This record contains 76 individual  * sequencing reads that have not been assembled into  * contigs. Runs of N are used to separate the reads  * and the order in which they appear is completely  * arbitrary. Low-pass sequence sampling is useful for  * identifying clones that may be gene-rich and allows  * overlap relationships among clones to be deduced.  * However, it should not be assumed that this clone  * will be sequenced to completion. In the event that  * the record is updated, the accession number will  * be preserved.  944: contig of 944 bp in length  935 1570: contig of 626 bp in length  * 1571 2381: contig of 811 bp in length  gap of unknown length  gap of unknown length  gap of unknown length  # 1571 2381: contig of 811 bp in length	Di Di Di Di Di Di Di Di Di Di Di Di Di D	ACO10535 ACO10535 ACO10535 HTG; HTGS; HTG sapid Homo sapid Eukaryota Eukaryota Mammalia; 1 (bases DOI joint Sequencinn Unpublisho	ATCO AC AC SZ	ProvalGlyGlnValArgValAspValAlaThrGlyV    :::    :::::     ::::  CCTTTAGGCCCGATGAAATTCAGGTACGCCTACCCGC	- AACAGCAGTTCCGCGACCGCGCAGGGTTCAAAACATTTACGGCGCCGCGAATACCCAT 2235LysGlyPheThrAsnAspThrLysIleGlyAlaGlyValGlyValArgTrpAlaSer 889LysGlyPheThrAsnAspThrLysIleGlyAlaGlyValGlyValArgTrpAlaSer 889	LeuArgLeuAlaValPheGlyAspIleGlyAsnAlaTyrAsp	ThralaGluTyrAsnTyrGluPheMet	ProIleSerAspLysGlyTyrLeuThrGlyGlyGlnValLeuAlaValGly

                                                                                                                                                                                                                                                                                                               The present sequence is that of the coding region of the BASB081 cgene from Moraxella catarrhalis MC2931 (ATCC 43617). A translation of the sequence is given in AAY95987. The present sequence shows 2C 99.9% identity to a BASB081 sequence (see AAA50537) obtained by PCR 2C amplification of plasmid DNA. The invention provides BASB081 pCR 2C polypeptides, polynucleotides, expression vectors, host cells, and 2C a process for producing a BASB081 polypeptide. Also provided are 2C vaccine compositions comprising a BASB081 polypeptide or 2C polynucleotide, and optionally at least 1 other M. catarrhalis 2C antigen. A method for diagnosing a M. catarrhalis infection 2C involves identifying a BASB081 polypeptide, or an antibody that is 2C immunospecific for it, in a sample. A therapeutic composition 2C immunospecific for it, in a sample. A therapeutic composition 2C infections be a bacterial infection, e.g. otitis media in infants 2C and children, pneumonia in elderlies, sinusitis, nosocomial 2C infections and invasive diseases, chronic otitis media with hearing 2C constituted speech learning, upper respiratory tract infection, and 2C infiammarion of the middle ear, auditive nerve damage, 2C infiammarion of the middle ear
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           New BASB081 polypeptides from Moraxella catarrhalis and polynucleotides encoding the polypeptides used for treating infections, or as a vaccine for preventing infections, especially those caused by M. catarrhalis -

The present invention relates to a Moraxella catarrhalis genomic librar comprising of a combination of 41 nucleic acid molecules (see AAF28514-AAF2854). The library has a number of uses described in the specification e.g. is useful for aidentifying diagnostic and therapeuti compositions. M. catarrhalis (Branhamella catarrhalis) is a large aerobic, gram-negative diplococcus, normally found among the bacterial flora of human upper airways. M. catarrhalis is known to cause acute, localised infections such as otitis media, sinusitis and bronchopulmona.

The present sequence is that of DNA encoding BASB081 mature protein CC (see AAY95988) of Moraxella catarrhalis Mc2931 (ATCC 43617). It was Cobtained by sequencing PCR-amplified DNA from a BASB081 expression CC plasmid. The sequence shows 99.9% identity to a mature BASB081 CC coding sequence (see AAA50537) obtained from M. catarrhalis ATCC 43617. CC The invention provides BASB081 polypeptides, polynucleotides, CC expression vectors, host cells, and a process for producing a BASB081 CC polypeptide. Also provided are vaccine compositions comprising a CC EAASB081 polypeptide. As provided are vaccine compositions comprising a M. CC catarrhalis infection involves identifying a BASB081 polypeptide, or CC catarrhalis infection involves identifying a BASB081 polypeptide, or CC catarrhalis infection useful in treating M. catarrhalis diseases in humans comprises an antibody directed against a BASB081 protein. CC infants and children, pneumonia in elderlies, sinusitis media in CC infections and invasive diseases, chronic otitis media with hearing CC infections and invasive diseases, chronic otitis media with hearing CC delayed speech learning, upper respiratory tract infection, and cc inflammation of the middle ear, auditive nerve damage, CC delayed speech learning, upper respiratory tract infection, and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             New BASB081 polypeptides from Moraxella catarrhalis and polynucleotiencoding the polypeptides used for treating infections, or as a vacc for preventing infections, especially those caused by M. catarrhalis

                                                                                                                                                                                                       The present sequence is that of the coding region of the BASB067 gene of Haemophilus influenzae strain Rd KW20. It encodes a 578-amino acid surface expressed protein (see AAY95820) that is recognised by the immune system. The invention relates to recognised by the immune system. The invention relates to polypeptides and polynucleotides, for use especially in therapeutic and prophylactic vaccines. It also relates to methods for using such polypeptides and polynucleotides, for the prevention and treatment of microbial diseases, in the prevention and diseases associated with microbial infections, and assays for detecting expression or activity of BASB067 plypeptides or polynucleotides. A polynucleotide having at least 85% identity to the present sequence can be used in the recombinant production of BASB067 immunogenic polypeptides in transformed host cells, and

                                                                                                                                                                                                                                                                                                                                                                        The present sequence is that of the coding region of the BASB067 Gene of Haemophilus influenzae non-typeable (Nthi) strain 289. The DNA was isolated by PCR using primers (see AAA50271-72) specific for the BASB067 gene. It encodes a 576-amino acid surface exposed protein (see AAY95821) that is recognised by the immune system. The invention relates to recombinant materials and methods for the production of BASB067 polypeptides and polynucleotides, for use capecially in therapeutic and prophylactic vaccines. It also relates to methods for using such polypeptides and polynucleotides in the prevention and treatment of microbial diseases, in diagostic assays for detecting diseases associated with microbial infections, polypeptides or polynucleotides. A polynucleotide having at least polypeptides or polynucleotides. A polynucleotide having at least (nucleotides 61-731) can be used in the recombinant production of BASB067 immunogenic polypeptides in transformed host cells, and in vaccine commonstrions
                                                                                                                                                                                                                                                                                                                                    Sequence 1731 BP; 509 A; 322 C;

                                                                                                                                                                                                                                                                                                                                                                                                                           Alignment Scores:
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        for identifying expressed genes. (1) is useful in gene therapy techniques (II). (II) is useful in gene therapy techniques (II). (II) is useful in gene therapy techniques (II). (II) is useful for generating antibodies against it, detecting or quantitating a polypeptide in tissue, as molecular weight markers and as a food supplement. (II) and its binding partners are useful in medical imaging of sites expressing (II). (I) and (II) are useful for treating disorders involving aberrant protein expression or biological activity. The polypeptide and polynucleotide sequences have applications in diagnostics, forensics, gene mapping, identification of mutations cresponsible for genetic disorders or other traits to assess biodiversity and to produce other types of data and products dependent on DNA and diagnostic coding sequences of the invention.

Note: The sequence data for this patent did not appear in the printed specification, but was obtained in electronic format directly from WIPO at first, wipo.int/pub/published_pct_sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The invention relates to isolated polynucleotide (I) and polypeptide (II) sequences. (I) is useful as hybridisation probes, polymerase chain reaction (PCR) primers, oligomers, and for chromosome and gene mapping, and in recombinant production of (II). The polynucleotides are also used in diagnostics as expressed sequence tags for instance of the polynucleotides.
                                                                                                                                           2094
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         New isolated polynucleotide and encoded polypeptides, useful in diagnostics, forensics, gene mapping, identification of mutations responsible for genetic disorders or other traits and to assess biodiversity
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Claim 1; SEQ ID No 28893; 103pp; English.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    31-MAR-2000;

                                                                                                                                                                                                                                                                                                                                                                                                                                      influenzae, including pneumonia, exacerbation of chronic bronchitis, sinusitis and otitis media; as immunogens to produce antibodies immunospecific for such polypeptides and polynucleotides, These may also be used in diagnosing the stage of infection and type of infection the pathogen has attained. The polynucleotides may be further used in genetic immunisation, as components of polynucleotide arrays useful for diagnostic and prognostic purposes, in the discovery and development of antibacterial compounds, and to interfere with the initial physical interaction between a pathogen and a eukaryotic host responsible for sequelae of infection. Compositions comprising the sequences of the invention are useful in the preparation of a medicament for generating an immune response in an animal. The present sequence represents the upstream DNA sequence of the Haemophilus influenzae BASB207 cDNA of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              BASB207 protein. The proteins of the invention may have antibacterial or anti-inflammatory activity and may be used to create a vaccine. The BASB207 polypeptides and polynucleotides are useful as vaccines against bacterial infections particularly those caused by non-typeable H. activities and polynucleotides are useful as vaccines against bacterial infections particularly those caused by non-typeable H.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 This invention relates to the cDNA and protein BASB207 protein. The proteins of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                New BASB207 polypeptides and polynucleotides, useful as vaccines against bacterial infections particularly those caused by non-typeable Haemophilus influenzae, e.g. pneumonia, sinusitis and otitis media -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                WPI;

Neisseria meningitidis colonises the pharynx, causing meningitis and, occasionally, septicaemia in the absence of meningitis. This antigenic protein is useful in the manufacture of a medicament for treating or preventing infection due to Neisseria bacteria, such as meningitis and septicaemia. It is also useful as a diagnostic reagent for detecting the presence of Neisseria bacteria or antibodies raised against Neisseria, and as a reagent for raising the antibodies. The Neisserial nucleotide sequences can be expressed in a variety of different expression systems, for example, mammalian cells, baculoviruses, plants, bacteria and yeast.

specification describes a composition, comprising a Neisseria meningitidis scrogroup B outer membrane preparation and an immunogenic component. The immunogenic component is protein disclosed in W099/57280 W099/36544, W099/24578, W099/66791, W097/28273, W096/29412, W095/03413

The present sequence encodes a Neisseria gonorrheae protein.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The present sequence encodes an outer membrane protein (omp) 85 of Neisseria gonorrinoeae. The omp polyprides and polynucleotides are useful in compositions for use in the prevention, treatment and diagnosis of non-symptomatic gonococcal infection or meningococcal infection and symptomatic disease. They are also useful for the detection of by his protein and the prevention of the detection of t
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Neisseria species. The proteins, antibodies and polynucleotide sequences of the present invention may also be used in the scream development of chemical compounds such as drugs or vaccines
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        hybridisation complexes. Antigens and antibodies specific omp proteins also provide diagnostic, therapeutic and prophylactic compositions for the treatment or prevention of the infections described above. The antibodies are useful for inducing a protective immune response in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            New isolated outer membrane protein 85 of Neisseria gonorrhoeae meningitidis useful for vaccine, therapeutic and diagnostic compositions for gonococcal or meningococcal infections -

The sequence represents a DNA encoding a Neisseria meningitidis serogroup B 85 kba antigenic protein. Neisseria meningitidis colonises the pharynx, causing meningitis and, occasionally, septicaemia in the absence of meningitis. This antigenic protein is useful in the manufacture of a medicament for treating or preventing infection due to Neisseria bacteria, such as meningitis and septicaemia. It is also useful as a diagnostic reagent for detecting the presence of Neisseria bacteria or antibodies raised against Neisseria, and as a reagent for raising the antibodies. The Neisserial nucleotide sequences can be expressed in a variety of different expression systems, for example, mammalian cells, bacteria and yeast.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 169
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        429

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The sequence represents a DNA encoding a Neisseria gonorrhoeae 85 kDa antiganic protein. N. gonorrhoeae is closely related to N. meningitidis, which colonises the pharynx, causing meningitis and, occasionally, septicaemia in the absence of meningitis. This antigenic protein is useful in the manufacture of a medicament for treating or preventing infection due to Neisseria bacteria, such as meningitis and septicaemia. It is also useful as a diagnostic reagent for detecting the presence of Neisseria bacteria or antibodies raised against Neisseria, and as a reagent for raising the antibodies. The Neisserial nucleotide sequences can be expressed in a variety of different expression systems, for example, mammalian cells, baculoviruses, plants, bacteria and yeast.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Novel 85 kDa antigen from Neisseria meningitidis and Neisseria gonorrhoeae, useful in the manufacture of a medicament for treating and preventing Neisserial bacteria infection -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ThrProLeuSerLeuGluGluLeuPheAlaGlnGluSerThrGluMetGlyIleAsnPro 135

The present sequence encodes a Neisseria serogroup B protein. The protein is used to produce the compositions of the invention. The specification describes a composition, comprising a Neisseria meningitidis serogroup B outer membrane preparation and an immunogenic component. The immunogenic component is protein disclosed in WO99/57280, WO99/3613, WO99/36813, WO99/36813, WO99/36813, WO99/56813, WO99/56813, WO99/5883, WO99/56813, WO99/5883, WO99/56813, WO99/56 Composition for treating or preventing infection to, detecting, or for raising antibodies against Neisserial bacteria, comprises an N. meningitidis serogroup B outer membrane preparation and an immunogenic Disclosure; Page 58-59; 83pp; English also be used as a vaccine. component

The present invention describes methods of obtaining immunogenic proteins from Neisseria genomic sequences. AAA81453 to AAA82414

represent specifically claimed Neisseria meningitidis genomic DNA sequences; AAA81360 to AAA81360 to AAA81560 to AAA81550 to AAA81254 to AAA81259 and AAA81360 to AAA8131 represent PCR primers used in the Sequences; AAA81354 to AAA81351 represent PCR primers used in the AAA81452 represent Neisseria meningitidis DNA sequences; and AAA8132 to AAA81452 represent Neisseria meningitidis DNA sequences; and AAA8132 to AAA81452 represent Neisseria meningitidis DNA sequences; and AAA8132 to AAA81452 represent Neisseria meningitidis DNA sequences; and AAA8132 to AAA81452 represent Neisseria meningitidis DNA sequences; and antibodies sequences, which are all used in the manufacture of a composition. The nucleic acid sequences, protein sequences, and antibodies against them, can be used as a medicament (or in the manufacture of a medicament) for treating, preventing or diagnosing infection due to medicament) for treating, preventing or diagnosing infection due to Neisserial bacteria. For example, some of the identification due to proteins conformed be components of vaccines against Meningococcus B; against all serotypes; and/or against all pathogenia. Neisseriae. Identification of biological probes, particularly organism-specific probes. Attempts to make efficacious or medicament vaccines have also been tried but none have successfully overcome antigenic variability. The provision of further, complete sequences may provide an opportunity to identify secreted or surface exposed proteins that may be presumed targets for the immune system and which are not antigenically variable or at least more conserved than every because the conserved than antigenic variable regions.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The present invention describes the full length genome of
Neisseria menigitidis B (NMB). The sequences in AAF21544 and AAF21607
Neisseria menigitidis B (NMB). The sequences in AAF21544 and AAF21607
to AAF21613 represent fragments of the NMB genomic sequence, as the
sequence was too long to go in a record on its own it was split into 8
sequences which overlap each other at the beginning and end of each
sequences which overlap each other at the beginning and end of each
sequences which overlap each other at the beginning of AAF21607, the last 49980 bp of AAF2164 is repeated at
the beginning of AAF21607, the last 49980 bp of AAF21540 are repeated at
the beginning of AAF21607, and so on). AAF21555 to AAF21589 encode the
Neisseria proteins given in AAB58550 to AAB58593, and AAF21589 to
AAF21606 represent PCR primers which are used in the exemplification of
the present invention. The NMB genome and fragments from it have
antibacterial activity, and can be used in vaccines and gene therapy.
Weisseria nucleic acids, proteins and/or antibadies which binds to the
proteins can be used in compositions for treating or preventing infection
due to Neisserial bacteria or as a diagnostic reagent for detecting the

presence of Neisserial bacteria or of antibodies raised to Neisserial bacteria. Computers, computer storage medium or computer databases can be used in a search to identify open reading frames (ORFs) or coding sequences within the NMB genome. The DNA sequences provide further opportunities to find antigenic or immunogenic proteins which are more effective in vaccines than the outer membrane proteins currently used.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Db 180761 TCGCCTTTGGCACTTGCCGACTTCACCATCCGAGACATCCGCGTCGAAGGCTTGCAGCGT 180702

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       δ
                                                                                                                                                                                                                                                                                                                                                                     The present sequence encodes an outer membrane protein (omp) 85 of Neisseria meningitidis. The omp polypeptides and polynucleotides are useful in compositions for use in the prevention, treatment and diagnosis of non-symptomatic genococcal infection or meningococcal infection and symptomatic disease. They are also useful for the detection of hybridisation complexes, Antiqens and antibodies specific omp proteins also provide diagnostic, therapeutic and prophylactic compositions for the treatment or prevention of the infections described above. The antibodies are useful for inducing a protective immune response in humans or animals with N. gonorrhoeae, N. meningitidis, or other Neisseria species. The proteins, antibodies and polynucleotide sequences of the present invention may also be used in the screening and development of chemical compounds such as drugs or vaccines.
                                                                                                                                                                                                                                                                                             New isolated outer membrane protein 85 of Neisseria gonorrhoeae and N. meningitidis useful for vaccine, therapeutic and diagnostic compositions for gonococcal or meningococcal infections
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                116 ThrProLeuSerLeuGluGluLeuPheAlaGlnGluSerThrGluMetGlyIleAsnPro 135

```
The present invention provides isolated polynucleotides encoding HtrA, PonA, HypC, LysS, YefW, ABC1 or Omp100 protein of Lawsonia intracellularis. The sequences can be used in vaccines for the prevention of Lawsonia intracellularis infection. The present sequence is a coding sequence of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    HtrA; PonA; HypC; YefW; ABC1; Omp100; Lawsonia intracellularis infection;
